Overview – The Dairy Goat Industry in Texas

As a tribute to the many Texans who raise dairy goats, this directory has been prepared to assist with marketing quality Texas dairy goat genetics. The Texas Department of Agriculture facilitates sales of Texas dairy goats to many countries, with Mexico being our biggest customer. Our hopes are to increase global exports of Texas dairy goat genetics by providing interested buyers with this comprehensive listing of Texas dairy goat producers.

Second to none, the Lone Star State is known as the livestock capital of the world – a distinction Texas producers have worked hard to achieve. As leaders in the production of beef cattle, horses, sheep and goats, Texas producers are committed to offering the best choice and variety of livestock. Texas produces the six nationally recognized breeds of dairy goats – Alpine, LaMancha, Nubian, Oberhasli, Saanen and Toggenburg. The dairy goat industry plays an important role in making Texas the nation's top goat producer.

Texans enjoy raising dairy goats for many reasons, whether starting production as a youth project, a hobby or just to harvest their own milk and meat. In prime lactation, a dairy goat will average a gallon of milk daily for over 300 days. Two such goats can provide more than enough milk for an average size family. On a worldwide basis, more people drink the milk of goats than that of any other single animal. Goat milk naturally has smaller fat particles and may be easier to digest. It is also a good source of protein and an excellent source of calcium, potassium, riboflavin and phosphorous.

Producing high quality milk efficiently is the primary purpose of the dairy goat. Accordingly, milk production is a major dairy goat selection criterion. Parity, or lactation number, in addition to age, has a large influence on milk and fat yield in dairy goats. The average difference in 305-day milk yields between the first and second goat lactation is approximately 300 pounds. Factors accounting for this variation in parity include the effects of previous lactation and seasonal breeding. It is also important to keep in mind that seasonal breeding can influence the length of lactation, which in turn affects yields.

Many dairy goats, in their prime, average six to eight pounds of milk daily (roughly three to four quarts) during a 10-month lactation, giving more after freshening and gradually dropping in production toward the end of their lactation. The milk generally averages 3.5 percent butterfat. A doe may be expected to reach her heaviest production during her third or fourth lactation.

Hardy, gentle, intelligent animals, dairy goats are usually seasonal breeders, and their season is initiated by decreasing daylight. Most breeding occurs in late summer through early winter. Goats have an 18 to 21-day estrus cycle or “season.” The doe’s season lasts from a few hours to two or three days. The gestation period is five months. Twins are common, but single or triplet births are not rare. A doe milks approximately 10 months following kidding and then is held dry for two months before her next freshening. The dairy goat lifespan is 8 to 12 years.

The selling price of does and their offspring is enhanced if those animals are registered with documented parentage and if high milk records are documented through a Dairy Herd Improvement Records testing program.

Whether you are interested in starting a dairy goat herd or are expanding your present one, we hope you find this directory a helpful resource in locating Texas dairy goat genetics and learning more about the breeds produced in the Lone Star State that will best meet your needs.

Procedures to Ensure a Smooth Livestock Export Transaction

Making a sale to a foreign market is not much different than selling to a neighbor, with a few minor exceptions. Once the foreign buyer has selected the animals and the selling price has been determined, the following steps will help ensure a smooth transaction:

- Request a down payment to cover your costs of testing the animals for export. This is a common practice.
- Determine with the buyer how and when final payment will be made. Payments can be cash, wire transfer to your bank, a United States bank check that can be confirmed or a letter of credit.
- Determine if the animals are to be sold free on board (FOB) ranch or if the sale price includes delivery to the port of entry. If the buyer is responsible for delivery to the port of entry, help him locate a trucker. You will be more familiar with truckers in your area, and the buyer will appreciate your help.
- Ask the buyer through which port the animals will enter his country and establish how you will give notice when the animals are ready for delivery - you may inform the buyer or deal directly with a broker at the port of entry. Before the buyer leaves your ranch, make sure you have his name, address and telephone number and the telephone numbers of the person or firm receiving the animals.
- Call your local veterinarian. Explain that you have sold livestock to a foreign buyer and need to have them tested for export. Your veterinarian will know the procedures and necessary tests. Veterinarians with questions may

contact the U.S. Department of Agriculture (USDA) at (512) 916-5555. Your veterinarian will prepare an export health certificate for the animals. This document will be sent to Austin with any necessary blood samples. The health certificate will be officially endorsed by USDA. The endorsement charge varies from species to species so it is advisable to call USDA to find out what the charges will be. Your veterinarian will charge you for his services and the official export health document. Remember that this added expense is your responsibility. You will need to price your livestock accordingly.

- Give each animal an identification number. This can be a brand, tattoo or ear tag. Your veterinarian will need these numbers to identify the animals on the health certificates. Numbered ear tags that can be read at a distance are usually best.
- Provide an invoice to the buyer. The invoice should include the seller's name and address, the buyer's name and address, number and sex of animals purchased and the price. This invoice and the export health certificate will accompany the livestock to the port of entry.
- Expect to receive full payment for your livestock before the animals leave the United States, also standard practice.
- Call the person or firm receiving the animals when you have secured the export health certificates and prepared your invoice. Set a delivery date. Contact the appropriate Texas Department of Agriculture (TDA) export facility and confirm the date of delivery. Normal working hours for TDA export facilities are Monday through Friday, 8 a.m. to 5 p.m.

If you have questions, contact the Texas Department of Agriculture at (512) 463-7560.

Puntos importantes para facilitar y asegurar una exportación de ganado proveniente del estado de Texas.

Si usted sigue los requisitos de su país de importación al adquirir nueva genética del estado de Texas, cualquier transacción será fácil y muy sencilla.

Tome en cuenta los siguientes pasos:

1. Contactar al Departamento de Agricultura del Estado de Texas.

Nuestra oficina de ganadería cuenta con personal capacitado y bilingüe que le diseñará una agenda de actividades, con la cual usted reducirá su tiempo de búsqueda debido a que nuestros especialistas lo llevarán al lugar exacto donde encontrar lo que usted busca, ahorrando de esta manera tiempo.

2. Selección.

Una vez que usted haya encontrado el lugar y la genética de su agrado, es una práctica común del comprador dar un anticipo para asegurar la transacción. Así el ganadero Texano, con este adelanto procede a cubrir los gastos de la elaboración de los certificados de salud para exportación, basados en los requisitos del país importador. El criador Texano es responsable de la elaboración de los mismos, contactando para ello a su médico veterinario, y este, a su vez, se registrará a través de la oficina de exportación del Departamento de Agricultura de los Estados Unidos (USDA, por sus siglas en inglés) donde le proporcionarán los requisitos exactos que cada país requiere. Es importante mencionar que estos certificados de exportación generalmente tienen una fecha de expiración de 30 días después de haberse expedido y el tiempo de preparación es de aproximadamente 10 días laborales. También es importante recordar que los animales seleccionados deben estar perfectamente identificados, ya sea con arete en la oreja, fierro

en una parte visible, ya sea en tren posterior o en ocasiones se marca en el nacimiento del hombro. El tatuaje es otra práctica muy común y en algunos países es requisito aretar y tatuar el ganado para facilitar su identificación.

3. Transportación.

Es recomendable que usted discuta todo lo que envuelve este punto con el propio criador Texano ya que el no hacerlo puede causar confusión de último minuto al tener el ganado listo para el envío.

4. Requisitos legales.

Es importante que el ganadero comprador esté familiarizado con los requisitos de su país destinatario ya que es importante proporcionar la información correcta y adecuada para la elaboración de los certificados de salud, tales como:

- Nombre del importador, en caso de ser persona física algunos países requieren que esté registrado en un padrón de importadores.
- Datos generales del importador (nombre, domicilio, teléfono, etc.).
- Puerto de entrada al país destinatario.
- Información completa del agente aduanal si así se requiere.
- Información completa de las personas o compañía que se hará cargo del ganado al llegar al puerto receptor.

5. Término de la Transacción. Una vez que el criador tenga los certificados sanitarios listos, se deben seguir las siguientes recomendaciones:

Acordar la forma de pago total (cheque de banco americano, transferencia de fondos, etc.), antes del embarque.
Coordinar la fecha y hora de embarque con las siguientes entidades:

Agente aduanal

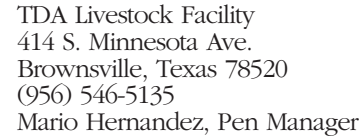

Corrales de exportación propiedad del Departamento de Agricultura del Estado de Texas (horario de lunes a viernes de 8:00 AM a 5:00 PM, se anexan las direcciones de las mismas en el estado).

Compañías transportistas

En el Departamento de Agricultura del Estado de Texas nos interesa servirle y ponemos a su disposición nuestra división de mercadotecnia agropecuaria en donde nuestro objetivo principal es hacer que el gremio agropecuario mundial pueda trabajar, como uno solo, y así resolver e implementar la alimentación de todos los países.

Alpine
dairy goat

Alpine Dairy Goat

The Alpine dairy goat is also referred to as the French Alpine and registration papers use both designations synonymously. The Alpine dairy goat is a medium-to-large animal, alert, graceful, and the only breed with upright ears that offers all colors and combinations of colors, giving them distinction and individuality. They are hardy, adaptable animals, thrive in any

climate, and maintain good health and excellent production. The hair is medium to short. The face is straight. A Roman nose, Toggenburg color and markings, or all-white are not desirable. Alpine colors are described by using the following terms:

COU BLANC (coo blanc) – *literally “white neck” – white front quarters and black hindquarters with black or gray markings on the head.*

COU CLAIR (coo clair) – *literally “clear neck” – front quarters are tan, saffron, off-white, or shading to gray with black hindquarters.*

COU NOIR (coo nwah) – *literally “black neck” – black front quarters and white hindquarters.*

SUNDGAU (sundgow) – *black with white markings such as underbody, facial stripes, etc.*

PIED – *spotted or mottled.*

CHAMOISEE (shamwahzay) – *brown or bay – characteristic markings are black face, dorsal stripe feet and legs and sometimes a martingale running over the withers and down to the chest. Spelling for male is chamoise.*

TWO-TONE CHAMOISEE – *light front quarters with brown or gray hindquarters. This is not a cou blanc or cou clair as these terms are reserved for animals with black hindquarters.*

BROKEN CHAMOISEE – *a solid chamoisee broken with another color by being banded or splashed, etc.*

LaMancha
dairy goat

LaMancha Dairy Goat

The LaMancha goat was developed in the United States. It has excellent dairy temperament and is an all-around sturdy animal that can withstand a great deal of hardship and still produce. Through official testing, this breed has established itself in milk production with high butterfat.

The LaMancha face is straight with the ears being the distinctive breed characteristic. There are two types of LaMancha ears. In does, one type of ear has no advantage over the other.

The “gopher ear” had an approximate maximum length of one inch (2.54 cm), but preferably is nonexistent with very little or no cartilage. The end of the ear must be turned up or down. This is the only type of ear that will make bucks eligible for registration.

The “elf ear” has an approximate

maximum length of two inches (5.08 cm) is allowed. The end of the ear must be turned up or turned down. Cartilage shaping the small ear is allowed.

Any color or combination of colors is acceptable, with no preferences. The hair is short, fine and glossy.

Nubian
dairy goat

Nubian Dairy Goat

Nubians (Anglo-Nubians) were developed in England by crossing British goats with bucks of African and Indian origin. Named for Nubia in northeastern Africa, the original goats imported from Africa and India were long-legged, hardy goats. English breeders crossed these imported bucks on the common shorthaired

does of England to develop the Nubian goat.

The Nubian is an all-purpose goat, useful for meat, milk and hide production. Though Nubians usually give less milk than the Swiss breeds, they produce milk of higher butterfat content (between 4 percent and 5 percent). The Nubian breeding season is much longer than that of the Swiss breeds, making it possible to produce milk year round. Of all the dairy goat breeds, the Nubian is the best suited to hot conditions and has been used in grading-up programs in many tropical countries to increase the milk and meat production of local breeds. The Nubian is a relatively large,

proud and graceful dairy goat. Any solid or partially-colored coat is permitted in the Nubian, but black, red or tan are the most common colors, any of which may be in combination with white. The head is the distinctive breed characteristic, with the facial profile between the eyes and muzzle being strongly convex. The ears are long (extending at least one inch beyond the muzzle when held flat along the face), wide and pendulous. They lie close to the head at the temple and flare slightly out and well forward at the rounded tip, forming a “bell” shape. The hair is short, fine and glossy.

Oberhasli
dairy goat

Oberhasli Dairy Goat

The Oberhasli is a Swiss dairy goat. This breed is of medium size and vigorous and alert in appearance. Its color is chamoisee. Chamoisee is a bay ranging from light to a deep red bay color, the latter being most desirable. A few white hairs through the coat and about the ears are permitted. Oberhasli goats have two black stripes down the face from above

each eye to a black muzzle. Their foreheads are nearly all black with black stripes from the base of each ear coming to a point just back of the poll and continuing along the neck and back as a dorsal stripe to the tail. They have a black belly and light gray to black udder, black legs below the knees and hocks and ears that are black inside and bay outside. Bucks often have more black on the head than does with black whiskers and hair along the shoulder and lower chest, and a mantle of black along the back. Bucks frequently have more white hairs through the coat than does. Does may be black, but Chamoisee is preferred.

The face is straight - the breed should not have a "Roman Nose."

Oberhasli are a recently recognized breed in the United States and insufficient records currently exist for breed comparison. They are expected to resemble the other Swiss breeds in milk and fat production. Popular in Switzerland, they are very well adapted for high altitude mountain grazing and long hours of marching. Milk production is variable. The breed is also called Swiss Alpine, Chamoisee or Brienzen.

Saanen
dairy goat

Saanen Dairy Goat

The Saanen dairy goat originated in Switzerland, in the Saanen Valley. In 1893, several thousand head were taken out of the valley and spread throughout Europe. Between 1904 and the 1930s, approximately 150 Saanens were imported into the United States from Switzerland and

later from England. Saanen does are heavy milk producers and usually yield 3 percent to 4 percent milkfat. They are medium to large in size (weighing approximately 145 lbs/65kg) with rugged bone and plenty of vigor. Does should be feminine, however, and not coarse. Saanens are white or light cream in color, with white preferred. Spots on the skin are allowed. Small spots of color on the hair are allowable, but not desirable. The hair should be short and fine, although a fringe over the spine and thighs is often present. Ears should be erect and alertly carried, preferably pointing forward. The face should be straight or dished.

A tendency toward a Roman nose is not desirable.

The breed is sensitive to excessive sunlight and performs best in cooler conditions. Shade is essential and tan skin is preferable.

Toggenburg
dairy goat

Toggenburg Dairy Goat

The Toggenburg is a Swiss dairy goat from the Toggenburg Valley of Switzerland. This breed is medium size, sturdy, vigorous and alert in appearance. The hair is short to long in length, soft and fine. Its color is solid, varying from light fawn to dark chocolate, with no preference for any shade. Toggenburgs have white markings are as follows: white ears

with dark spot in the middle, two white stripes down the face from above each eye to the muzzle, white hind legs from hocks to hooves, and white forelegs white from knees downward. A dark vertical stripe below the knee is acceptable. Their tails should have a white triangle on each side, and a white spot may be present at the root of the wattles or in that area if no wattles are present. Varying degrees of cream markings instead of pure white are acceptable, but not desirable. The ears are erect and carried forward. Facial lines may be dished or straight, never Roman.

Toggenburg goats perform best in cooler conditions. They are noted for their excellent udder development and high milk production. The milk has an average butterfat content of 3.7 percent.

Every effort has been made to include all current Texas dairy goat breeders; however, if a producer has been inadvertently omitted, please contact the Texas Department of Agriculture at (512) 463-7560 with the information. Timely updates will be made to the directory to include additional breeders as their information is received. For the most complete and current listing of Texas dairy goat breeders, please visit our web site at www.agr.state.tx.us.
